Abstract (en)

[origin: EP1895090A1] The method involves setting a rotatably driven drill pipe (1) and a conveyor screw (2) into rotation, and introducing the drill pipe and the screw into soil. An outcropping soil material is loosened by a set of main cutting edges (50, 50°) positioned axially in front of the conveyor screw, and is conveyed away by the conveyor screw inside the drill pipe. The main cutting edges are arranged in the drill pipe and are rotated with the drill pipe. The drill pipe and the conveyor screw are controlled independently of each other with regard to rotational speed and/or direction of rotation. An independent claim is also included for a device for producing a borehole in soil.
