Abstract (en)
[origin: WO2006136253A1] The invention relates to a method for starting up a system and to a corresponding system, comprising parameterizable drives, which are connected to a second computer for exchanging data, in particular for transmitting parameters to the drives, whereby at a second time domain during the start-up, parameters intended for the respective drive are transmitted from the second computer to the respective drive. The parameters for the drives are created at a first time domain by a first computer, whereby the first computer, in order to exchange data, is connected at least intermittently to the second computer.
