Abstract (en)  
[origin: EP1898670A2] The method involves providing a measuring device for executing an open loop gain-measurement of a hearing device in a wear condition. The open loop gain-measurement is compared with an open loop gain-reference curve, where the comparison takes place through distance measurement between the open loop gain-measuring curve and open loop gain-reference curve. A value representing a closing degree of the hearing aid or otoplastic in the ear of a wearer is determined from the comparison. Independent claims are also included for the following: (1) a method for adaptation of amplification of a hearing aid with a determination of an effective vent (2) a device for determination of an effective vent of a hearing aid (3) a device for adaptation of the amplification of a hearing aid with a determination of an effective vent.
