Abstract (en)

[origin: WO2007037689A2] Insertion device for inserting an IOL. It consists of a pointed part and connected thereto wing parts which can be moved towards one another from an open position for folding an IOL which is then inserted into the insertion channel of the pointed insertion part of the insertion device. To lock the IOL in the correct position there are retainer means which consist of a retaining lip fitted to a wing part. The wing parts are to be locked to one another only after the retaining lip has been removed. The invention also relates to a packaging in which there is the combination of insertion device and retainer means, including lens, so that before the lens is positioned the user has only to move the wing parts towards one another when the retaining lip is removed and then insert the insertion device with IOL into an injector.
