Abstract (en)
[origin: WO2008006746A2] Relates to a container (1) for providing and transferring liquids, which is implemented as essentially tubular and comprises an intake opening (2) for introducing the liquid, and which comprises an external wall (4) and the floor (5), which are impermeable to liquids. The container according to the present invention is characterized in that this floor (5) comprises an area (6) which, to discharge liquids (7) from the inner chamber (8) of the container (1) into another container (9), may be opened or at least made permeable to these liquids (7). In addition, those containers (1) are disclosed which are characterized in that they are suitable as collecting containers (11) for collecting and providing forensically relevant samples using a sample carrier (3), in that they comprise retention means (13) that are permeable for these liquids (7), using which the sample carrier (3) is retained in these collecting containers (11) when the area (6) of the floor (5) is pierced, made permeable, or opened.
