Abstract (en)
[origin: US2008095606A1] A lifting device includes a lifting element with at least one holding element supported thereon. The holding element is adapted for holding a section of a human arm to provide support when the hand grips an object which is to be displaced. An operator of the lifting device may place their arm in the holding element and then use their hand to grasp an object to be displaced. The lifting device allows the grasped object to be displaced while the weight of the grasped object is borne through the holding element and lifting element.
