Abstract (en)
[origin: WO2006128067A2] A new ergonomic game cabinet with a unique layout is disclosed. The gaming machine cabinet includes a display mounted nearly vertically, combined with a player deck extending towards a player having more space at a more useful angle than previously available. The player deck will have open space usable by a player for small items (wallets, purses, chips, etc.), a player device area (typically buttons), and then a further area where a player can rest their arms, wrists, or elbows and comfortably reach the player device area. This further area may also be used for small player items, such as chips, tickets, etc. In addition, the new cabinet provides side panels on each side of the gaming machine cabinet that creates a feeling of being "surrounded" by the game experience due to reduced noise and visual distractions from nearby gaming machines, other patrons, waitrons, and the like.
