Abstract (en)
[origin: EP1900405A2] A reference character is generated by combining part objects prepared for each site. At least one candidate character object is generated by changing at least one part object among the part objects used in the reference character object. The reference character object and the candidate character object are displayed by a display device, and an input for selection from a user is accepted. Next, a site for which different part objects are used between the selected character object and the reference character object is determined. A new character object is generated by changing the part object used for the determined site with priority. The selected character object is displayed as the reference character, and the newly generated character is displayed as the candidate character.
