Abstract (en)

The invention finds application in the field of aseptic flexible containers (bags) having a spout (50) fitted with a membrane, through which the food product is introduced by an aseptic filling system. These flexible containers have a spout through which the product is filled. Once the bags have been filled, they are sealed still in the filling head to prevent any disruption of the asepsis and to preserve the integrity of the product. The novel apparatus has means (1) for loading a foil (51) or (52), which consist of a mechanical arm external to the filling head. The arm moves the foil into the filling head through transfer means (6) and (10). The foil is captured by the vacuum created within the heat sealing head, and the bag spout is inserted therein to close the pre-chamber, whereupon sterilization of the spout and foil is initiated.
