Abstract (en)
A lid (10) for a container is provided. The lid (10) may include a central panel (12), an annular wall (14), an outer flange (18), an upwardly projecting ring, and an internal lip (26). The annular wall (14) extends around the outer periphery of the central panel (12). The annular wall (14) defines a recessed area adapted to engage an inward portion of the container. The outer flange (18) extends outwardly from an upward region of the annular wall (14) to a curled outer edge. The curled outer edge extends inward of and above a top edge of the container, such that the top edge of the container and the outer edge of the lid may support a second container stacked upon the first container. The internal lip (26) extends inwardly from the upward region of the annular wall (14) such that it provides a surface for fingers to grab and aid in the removal of the lid (10) from the container.
