Abstract (en)  
[origin: WO2006119979A1] The device has a suspension device (11) for picking up a person (10) A counterforce (12) is coupled to the suspension device and a movement device (13) is connected to the suspension device. The movement device is actuated by the persons own muscular power, and connected to the suspension device in such a way that the person situated in the suspension device, by actuating the movement device by lateral lifting and lowering of his arms (14), executes a movement, which is similar to bird flight, upwards counter to the force of gravity.  
[origin: WO2006119979A1] The invention relates to a device for the three-dimensional movement of a person with a suspension device (11) for picking up the person (10). A device according to the invention is characterized by - a counterforce (12) coupled to the suspension device (11), - a movement device (13) which is connected to the suspension device (11), - the movement device (13) being actuatable by the person's (10) own muscular power, and the movement device (13) being connected to the suspension device (11) in such a manner that the person (10) situated in the suspension device (11), by actuating the movement device (13) by lateral lifting and lowering of his arms (14), executes a movement, which is similar to bird flight, upwards counter to the force of gravity.
