Abstract (en)
[origin: WO2007009106A1] A life vest container includes a hollow housing defining a storage volume adapted to receive a flotation device, the housing having an opening communicating with the storage volume. A cover is attached to the container and is moveable between a closed position in which it encloses the opening, and an open position in which the opening is accessible. Structure is provided for attaching the housing to a passenger seat, and for securing the cover in the closed position. At least a portion of the housing or the cover is sufficiently light-transmissive to allow observation of the condition of a flotation device disposed within the storage volume.
