Abstract (en)
[origin: WO2007007004A2] The invention concerns an oscillating arm (5) having a length (L) suitable to provide it with high stiffness in its oscillation plane and a thickness (t) suitable for providing it with a low stiffness in a plane perpendicular to said oscillation plane, said arm (5) being mounted in combination with guide means (9), (10) configured to limit or prevent, in said perpendicular plane, deformations resulting from the low stiffness of the arm in said plane and to enable the alternating rotational movement of said arm between two angular positions.
