Abstract (en)

[origin: WO2006134372A2] A safety apparatus includes a first member (28) defining a profiled channel (30) and adapted to be coupled to a frame (10) of a closure assembly, and a second member (38) defining a profiled portion (44) and adapted to be coupled to a closure device (12), wherein said profiled portion (44) is adapted to be received within the profiled channel (30) and to rotate therein when the closure device (12) is pivoted relative to the frame (10) to open and close an aperture. In one disclosed embodiment the second member (38) is a pivoting member adapted to be pivotally mounted on the frame (10) of the closure assembly via a pivot assembly (82), wherein said pivoting member is coupled to the closure device (12), such that said closure device (12) is pivotally mounted on the frame (10) via said pivoting member, said pivoting assembly (82) comprising a pivot shaft (40) adapted to extend between the pivoting member and frame (10) and adapted to be retracted into at least one of the pivoting member and frame (10).
