Abstract (en)

[origin: WO2007000511A1] The invention relates to a machine (M) for dispensing paid in cash products and/or services comprising a banknote reader (L) and a removable receiver (R) which are placed in a first compartment (C1), wherein said removable receiver (R) is held, in the operating position thereof, in said first compartment (C1) by locking means in such a way that it communicates with the output of the banknote reader (L) for receiving and storing processed banknotes. According to said invention, the machine comprises a second collecting compartment (C2) which is accessible from the outside of the machine by opening an access flap (D2) which is connected to the second compartment and movable between the closed position of the second compartment (C2) and an open position, wherein said open position of the access flap (D2) automatically controls the receiver unlocking means (V) in such a way that said receiver is transferred from the first compartment (C1) to the second compartment (C2) by the internal connection channel (7, 8) of the machine.
