Abstract (en)

[origin: EP1902758A1] The board (1) has front and rear ends (6, 7) e.g. shovel and tail, remote from one another according to an longitudinal axis, where the board is constituted by an interposed structure having monobloc core and placed between upper and lower supports. Each support has a longitudinal slot, so that reduced thickness of reinforcement is provided at top and/or bottom of the structure, in one of two zones (Z1, Z2) of one end. Discontinuities of the supports are provided in the zone (Z2) if a cut is realized in the rear end. The slot is gratified by a connection element made of material e.g. rubber.
