Abstract (en)
[origin: EP1902840A2] A positive planographic printing plate precursor that can be subjected to direct plate making due to scanning exposure based on a digital signal and is excellent in the reproducibility of a high definition image, the printing durability of a small-area image portion such as a dot or a fine line, and chemical resistance, is provided. The invention provides a planographic printing plate precursor formed by disposing, on a support, a recording layer that includes a lower layer containing a polymer compound having a constituent expressed by formula (I) below and an upper layer that contains a water-insoluble and alkali-soluble resin and an infrared absorber and increases in solubility to an alkaline aqueous solution under exposure, wherein in formula (I), n represents an integer from 0 to 2 and A represents an aryl group.
