Abstract (en)

[origin: US2008040977A1] A security window or door has a first locking element fixedly coupled to a pushrod of a casement guided in a mortise area between the casement and a frame which is engaged in formfitting manner in a tilted position of the pushrod with a second locking element fixedly connected in the frame such that both locking elements are pivotable in relation to one another around a tilt axis and disengaged in a rotating position of the pushrod with the second element connected to the frame in fixed manner so that a rotational movement of the casement around the rotational axis is possible and wherein the first locking element is provided with either a pin engaged in a matching bearing hole of the second locking element or at least one bearing hole with which the pin of the second locking element may be engaged with a tilted or a closed position of the pushrod.
