Abstract (en)
[origin: WO2007006286A1] An expandable endovascular implant (10) of the stent type is described, which is suitable in particular for occlusion of a blood vessel (31). The implant comprises a circumferential tubular wall extending about a longitudinal axis and composed of a radially expandable, flexible lattice structure, said wall enclosing a cylindrical hollow space with a cross section, characterized in that the cylindrical hollow space defined by the wall is narrowed at at least one location along its axis.
