Abstract (en)

[origin: US2008196819A1] A process and a device for the splicing of label bands having a conveying device for the forward movement of a first forward label band and of a second trailing label band along a transport path, and a splicing station for exerting a splicing pressure during the transport. In order to ensure that the splicing can be carried out reliably and precisely, even at high band speeds there is provided within the transport path in front of the splicing station, a separating device for the formation of a defined end edge on the trailing end of the forward label band.
