Abstract (en)  
[origin: WO2007010004A1] A method for sensitive and specific detection of cytosine methylations is described, in which the DNA to be analyzed is first enriched. The enrichment can in particular be methylation-specific, sequence-specific or source-specific. The enriched DNA then undergoes methylation-specific conversion. The converted DNA can be analyzed using different methods, in particular by real-time PCR methods.
