Abstract (en)

[origin: FR2906156A1] The device has a support part (8) retaining front and rear fixations (4, 6) e.g. stop and heel piece, in a determined longitudinal position. The fixations have a base with a lock that is movable in vertical displacement, for being displaced towards upper unlocking and lower locking positions, and vice-versa. The lock is solicited by an elastic system i.e. springs, from unlocking to locking positions along which the lock is co-operated with the part. A maintaining unit maintains a removable unlocking tool (15) with a rod, in a transversal position, and retains the lock in the upper position.
