Abstract (en)

[origin: EP1905971A2] The device (1) has a separation element (6) with a filtering medium (7) extending between upper and lower flanges (8, 9). A flexible membrane (10) is disposed at the interior of a case (2) to form an isolating plug and is made of elastomer material. The membrane is in a position which allows communication between inlet and outlet pipes (5, 13) in form of tubes or in another position which prevents the communication. The membrane presents an external edge (11) which is directly wedged in a sealed manner between the flange (8) of the element and a cover (12) of the device.
