Abstract (en)  
[origin: EP1906114A1] The heat exchanger has a heat transfer area, a manifold (5) and an accumulator (6), which is arranged laterally from the manifold and connected with the manifold by two overflow openings. The lamellae are arranged on the outer side of the accumulator, which are extending outwards. The accumulator is formed by a ring shaped extruded area on a part of its length, from which one of the lamella sticks out in the partial area. The other lamella extends over the total length of the accumulator, where one of the lamina is arranged either at the air inlet side or at the air outlet side.
