Abstract (en)
[origin: EP1906370A2] The system has a local central processing unit, sensor devices and an alarm system. The central processing unit has a truth table containing given logical signal sequences. The processing unit changes from an operating condition into a warning condition when deviating a succession of signals received from the sensor devices to the truth table. The signal sequences are combined into events and time windows are assigned to the given signals and/or events. The processing unit changes into the warning condition when holding off the signal and/or event within an assigned time window. An independent claim is also included for a method for the monitoring and signaling of a person in helpless situations.
