Abstract (en)

[origin: EP1906700A2] The method involves classifying (S2) a hearing situation automatically, adjusting a parameter of a signal processing device of a hearing device and automatic learning (S5) of the adjusted parameter for the actual hearing situation. The steps of classifying, adjusting, and actuating the automatic learning are temporarily monitored (S4), if the classified hearing situation and the adjustment have a specified non changeable time period. An average value and a variance of a level is analyzed by the automatic classification. An independent claim is also included for a hearing device.
