Abstract (en)

[origin: WO2007009263A1] A method is provided for maintaining a data set associated with an implant device intended for use during implant surgery on a selected patient. The method includes the steps of: storing pre-operative planning information in the data set configured for use during the implant surgery, the pre-operative planning information comprising image data representing the anatomy of the selected patient, a definition of the implant device based on an analysis of the anatomy represented in the image data such that the definition of the implant device includes one or more implant devices each having at least one different implant property, and surgical information including placement information of the implant device on the anatomy. The data set can then be amended to include intra-operative information including the actual implant device used during the implant surgery and details of the actual placement of the implant device used during the implant surgery. The amended data set is stored for subsequent access to facilitate outcome analysis (i.e. post-operative analysis) of the pre-operative planning information and the intra-operative information associated with the implant device.
