Abstract (en)

[origin: WO2007000619A1] The invention concerns the use of a mixture of superoxide dismutase and catalase for preparing a topical composition for treating inflammatory skin lesions, said lesions being selected among the group consisting of dermal fibroses, epidermal keratoses, cheloid scars or hypertrophic eschars. The inventive compositions are formulated to obtain all galenic forms conventionally used for applying a topical composition on the skin such as for example milk, cream, lotion, plaster or patch, as powder sticks to be solubilized in water or physiological serum prior to use.
