Abstract (en)

[origin: WO2007009904A1] The present invention relates to a catalyst, containing a carrier and a catalytically active material. The particles of the catalytically active material are distributed bimodally according to size. The fraction of larger particles of the catalytically active material and the fraction of smaller particles of the catalytically active material are evenly mixed in the catalytically active layer of the catalyst. The catalytically active materials amounts to 50 wt. % or less relative to the catalyst. The invention also relates to a method for producing or for regenerating a catalyst such as that claimed. In a first step of the method, a catalytically active material located on a carrier is coagulated. In a further step, an additional catalytically active material is applied to the carrier. The invention also relates to the use of the catalytically active material for the dehydrogenation of five or six-membered carbon-containing molecular rings to produce aromatic compounds.
