Abstract (en)

[origin: WO2007012436A1] The invention relates to a motor vehicle seat, in particular for a motorcar, provided with an air supply device (4) for supplying an air flow exiting from an air output opening (6), to the head, neck and shoulder area of a passenger comprising a heating and/or cooling system (5) for heating and/or cooling said air flow. The aim of said invention is to design an air supply device (4) for a motor vehicle seat, whose heating and/or cooling system (5) exhibits an improved degree of efficiency. For this purpose, a sandwich (18) comprising at least one heating and/or cooling layer (14, 28, 34) and at least one air penetratable layer (10, 12, 30, 32, 38) and provided with a structure (40, 40', 40'', 40''' ), which makes it possible to convert the air flow into turbulent or diffused steam is used.
