Abstract (en)  
[origin: WO2007012864A1] A ground reinforcement apparatus comprising a facing element having an outer surface and an inner ground engaging surface, in which the inner ground engaging surface comprises at least one socket, an attachment member and a strip. The strip may be looped around the attachment member. The attachment member may be received and engaged in the socket. The socket comprises a chamber partially closed by an annular lip to provide an opening. The lip includes two diametrically opposed rebates dimensioned to receive the attachment member and a strip looped thereon. The attachment member and the strip when passed through the rebates into the chamber of the socket may be rotated so that the attachment member engages the lip preventing withdrawal of the attachment member and the strip from the chamber of the socket.
