Abstract (en)

[origin: US2008210681A1] In an operating method for a hob having a plurality of heating elements, an operating action for a heating element, such as heating with an additional region on the cooktop or invoking a parboiling step, is selected in an initial step by providing input to a general input sensor element that is not associated with any specific heating element. In a subsequent step, the selected operating action is allocated or associated with a specific heating element by operating a cooking element specific sensor element, for example when setting the power level for that heating element. Therefore, sensor elements can be provided with an advantageous multiple-use effect for general operating actions. Furthermore, the operating sequence permits simple and convenient operation.
