Abstract (en)

[origin: EP1908366A1] The fastener has sliding rollers gripping with respective slides (18) that delimit homologous paths extending in planes parallel to a longitudinal axis of elongated branches (1, 2). Respective transversal sections of the slides and the rollers have complementary adjacent surfaces for limiting movements of the rollers to a single degree of freedom corresponding to a sliding path of the slides, to assure a free movement in translation of a connection unit (20) when longitudinal positioning notches (14) and locking elements are not in grip with each other.
