Abstract (en)

[origin: EP1908723A1] The frame has support arms articulated around a vertical axis (8) on a fixed central structure (2). Each arm is folded against the structure for transporting a hoisting engine. Connection between an end of each arm and the structure is made by an articulation device, which has a lower end (10) with a trunnion on the arm. The device introduces a lower semi-yoke (20) of the structure and an upper end (15) with the trunnion in a bore (21) and introduces an upper semi-yoke in a semi-bore (26). A removable support plate (28) with a bore (29) completes the semi-yoke (25).
