Abstract (en)

[origin: WO2006134278A1] The invention concerns a system for maintaining the arrow of a fishing gun. It consists of mobile elastic or deformable mobile elements (12) arranged proximate the head (4) of the gun and adapted to be deformable so as to allow through the arrow (5) at the time it is set on the head, then to recover their initial position or shape to maintain it sufficiently fixed in said point, while maintaining a minimum clearance between it and the head (4) so as to allow its longitudinal movement upon firing. The invention generally concerns the industrial and commercial field of manufacturing and distributing equipment designed in particular for sea or fresh water divers.
