Abstract (en)

[origin: WO2007014953A1] An active matrix for a liquid crystal display device comprises pixel electrodes arranged according to a cross grating of rows and columns. Associated to each electrode pixel, an electronic control device is provided that has a first switching element (T) connected between the pixel electrode ($E_{p,i,j}$) and an associated column (C_{j}), a control electrode (g) of the first switching element (T) being connected to an associated line ($R_{i,j}$). The control device comprises an initialization circuit for said pixel electrode comprising a second switching element (T'), connected to the pixel electrode ($E_{p,i,j}$) and of which a control electrode (g') is connected to a preceding row (R_{i-1}) of the grating. The invention is for use in active matrix bistable nematic displays.
