Abstract (en)
[origin: WO2007009748A1] The invention relates to a device for producing a catch in an operator's element for a motor vehicle. Said device comprises a cylindrical molded part (1) which is provided with catching cavities (5). The molded part (1) is connected to a control button of the operator's element such that the molded part (1) can be rotated with the aid of the control button. The inventive device further comprises at least two clamping springs (3, 6) that tangentially lean on the molded part (1) and are fitted with an elevation (4, 15) which is supported in the catching cavities (5) of the molded part (1). One clamping spring (3) is retained in a fixed manner in the operator's element while the other clamping spring (6) is loosely retained therein.
