Abstract (en)

[origin: EP1911689A1] The button (10) has a body (11) including a support wall (14) for receiving a finger of a user and a lateral wall (15), which extends from the support wall to a free end (16). A flow conduit (12) is extended in the body and emerged towards outside by an outlet unit (20) to project with respect to an outer surface of the lateral wall. A covering element (13) partially covers the outer surface and integrated to the body. The element is arranged under the outlet unit and is encased on the lateral wall by the free end, where the outlet unit and body are made of the same material. An independent claim is also included for a method for fabricating a push button.
