Abstract (en)

A method for erecting a concrete wall on a ground surface using a vertically movable shuttering is provided, wherein before pouring concrete a lining is provided on the parts of the shuttering intended to contact the concrete, which lining during the movement of the vertically movable shuttering is maintained stationary relative to the concrete, and which lining will be removed from the concrete wall when the concrete has cured to a certain degree. The lining is maintained stationary by being temporarily mechanically connected to a stationary part, for example the ground surface, the concrete wall itself or a separate support frame.
