Abstract (en)  
[origin: EP1913834A1] The applicator (2) has a support (10) mounted on a transmitting apparatus (3) transmitting off centered rotational movement to the applicator. An elastically deformable application element (11) is connected to the support during utilization. A central opening element acts on a closing element to connect a container and the application element, and exerts an action on the closing element when sufficient pressure pressing the closing element inside the container is exerted on the application element. A disc shaped intermediate element is provided between the application and closing elements. The application element is made of foam with open cell or semi open cell. The application element is applied on keratinous material. Independent claims are also included for the following: (1) a method for cosmetic processing by an applicator (2) an assembly comprising an applicator.
