Abstract (en)

[origin: WO2007016989A1] Disclosed is a control device of a motor vehicle, especially for an adjusting mechanism, comprising an arithmetic unit (1000) that is designed for controlling a functional unit of the motor vehicle, a volatile memory (RAM) for storing control data (N-Byte), which is connected to the arithmetic unit (1000) in order to store the control data (N-Byte), a non-volatile memory (EEPROM), and a switching circuit. The switching circuit and/or the arithmetic unit (1000) are configured for controlling the arithmetic unit (1000) into a sleep mode and/or switching off a power supply (190) for the arithmetic unit (1000). The switching circuit is configured for transferring the control data (N-Byte) from the volatile memory (RAM) into the non-volatile memory (EEPROM) in the sleep mode or the switched-off mode of the arithmetic unit (1000).
