Abstract (en)

[origin: WO2007017300A1] The invention relates to a method for triggering a hybrid vehicle comprising at least two driving engines (11, 12), in which the driving process is performed by means of the first driving engine (11), especially an internal combustion engine, and/or the second driving engine (12), particularly an electric motor, according to the stipulation of an operation controller (10), the share of the driving effort made by the second driving engine (12) being controlled in accordance with data which relates to the route and is communicated to the operation controller (10) while taking into account a charge status (L) of an energy store (14). An optimized operating strategy is determined by presetting a geographic destination and/or a target parameter of the operating strategy, the route being selected by taking into account the optimized operating strategy when alternative routes are available.
