Abstract (en)

[origin: WO2007017393A2] The invention relates to a method for processing data items and/or instructions during which the processing is different between at least two operating modes, and a first operating mode corresponds to a comparison mode and a second operating mode corresponds to a performance mode. During the comparison mode, a comparison unit is activated, and this comparison unit is deactivated in the performance mode. The invention is characterized in that the comparison unit is activated for the comparison mode according thereto, at least two identical data items and/or instructions are processed, and the at least identical data items and/or instructions are each distributed by a control unit to the at least two execution units.
