Abstract (en)

[origin: EP1755049A1] The method involves transmitting network side (5) and auxiliary information to a client (9). One of the information servers is connected with a communication network, where a profile (15) of a profile server (13), connected with the network, is provided. Profile information for creating the profile is evaluated and determined depending on the characteristics of the network side transmitted from the information server to the client. Independent claims are also included for the following: (1) a client-server-system having a client that is assigned to a user (2) a profile server in a client-server-system (3) a computer program that is executable in a client and/or a server and programmed in a manner such that a method of transmission of information from an information server to a client is implemented, when the computer program is executed in a client-server-system.
