Abstract (en)  
An elevator door has a hall door and a car door. The car door is displaceable between a door juxtaposition position at which the car door is juxtaposed to the hall door and a door deviation position at which the car door is located on a door opening side with respect to the hall door by a predetermined distance from the door juxtaposition position. When the car door is located at the door deviation position, the hall door and the car door are moved in engagement with each other. An actuating strip is provided between the car door and the hall door. The actuating strip is displaceable between a protruding position at which the actuating strip protrudes in a door closing direction from a door closing-side end of the elevator door and a retracted position at which the actuating strip is accommodated between the car door and the hall door. The retracted position is located on the door opening side with respect to the protruding position. When the hall door fully closes a doorway, the car door is displaced between the door juxtaposition position and the door deviation position. When the car door is located at the door juxtaposition position, a displacement device displaces the actuating strip to the protruding position. When the car door is located at the door deviation position, the displacement device displaces the actuating strip to the retracted position.
