Abstract (en)  
[origin: EP1918529A2] The machine has a flow channel, and a stator vane (2) rotatable about a rotating axis (1) arranged in the channel. The stator vane has a rotary disk (3) in radial end areas of the stator vane. The disk has a cross section that is designed non-circular towards the rotating axis. The cross section of the disk has two parallel, even or curved flanges (S, D) in opposite sides of the disk. The vane adjacent to the disk is supported in overlapping circular recesses in a housing component (5) and/or hub component (4), where the flanges are linearly designed.
