Abstract (en)

[origin: US2007000007A1] Dynamic visual indicators such as counter-predictive indicators are applied to apparel and apparatus for activities such as athletics. The counter-predictive indicators are configured to provide an indication of wearer/user orientation or anticipated future movement that differs from a true orientation or actual movement. Alternatively, the predictive indicators can be provided to reinforce or heighten perception of wearer/user orientation or anticipated future movement. In some examples, dynamic visual indicators provide apparent body axes that are tilted or displaced from a wearer's actual body axis. Such dynamic visual indicators can be selected based on measured responses to activity specific images or events.
