Abstract (en)
[origin: EP1758333A1] The method involves assigning a border gateway and an application level gateway to a database, where the database defines internet protocol (IP)-addresses to be predetermined. The IP-addresses effect manipulations of speech packets by speech processing functions at the speech packets. The database is configured by a network-management over a protocol for the IP-gateways. The IP-gateways have an incomplete protocol-stack up to an IP-layer.
