Abstract (en)
The invention relates to ergonomic flooring which is intended for use as a floor covering and which comprises a stiff, wear-resistant layer (1) and at least one absorbing layer (2). The resistant layer is made from materials having high resistance to wear and stiffness values in order to confer mechanical and durability properties on the flooring and the absorbing layer (2) is made from deformable materials in order for the impacts associated with the movement of users to be absorbed, such that the layers can be joined to one another in the most suitable manner to meet the requirements of each flooring application, including by means of stacking.
