Abstract (en)
[origin: WO2007021120A1] Disclosed herein is a suction hose supporting structure of an upright type vacuum cleaner capable of being converted to a canister type. The vacuum cleaner comprises a main body (10) having a suction port (12) and a discharge port (14), a suction unit (15) having a dust collecting port and a discharge opening (18), an extension pipe (30) and a handle (20) detachably installed to the main body (10), a suction hose (70) connected at one end with the suction port (12) and selectively connected at the other end with the discharge opening (18) or the handle (20), a bending prevention member (80) installed at one side of the suction port (12) to support the suction hose (70) in a round state, and a fixing ring (90) installed to one side of the suction hose (70) and having a hook (92). When the vacuum cleaner is used as the upright type, the suction hose is prevented from being bent, thereby minimizing resistance in a flow passage.
